

## 1. Disk cleanup.

- Run Command Prompt as Administrator
- Find your CF-card entering "list disk"
- Select the disk using "select disk X", where X is your disk number.
- Enter "clean" command, then "exit".

```
Administrator: Command Prompt - diskpart
C:\Windows\system32>diskpart

Microsoft DiskPart version 10.0.19041.3636

Copyright (C) Microsoft Corporation.
On computer: WORKSHOP

DISKPART> list disk

   Disk ###  Status       Size       Free      Dyn  Gpt
   -----  -
   Disk 0      Online        931 GB         0 B
   Disk 1      Online      1863 GB    1024 KB
   Disk 2      Online      3781 MB    4032 KB
   Disk 3      No Media         0 B         0 B
   Disk 4      No Media         0 B         0 B

DISKPART> select disk 2

Disk 2 is now the selected disk.

DISKPART> clean

DiskPart succeeded in cleaning the disk.

DISKPART> exit

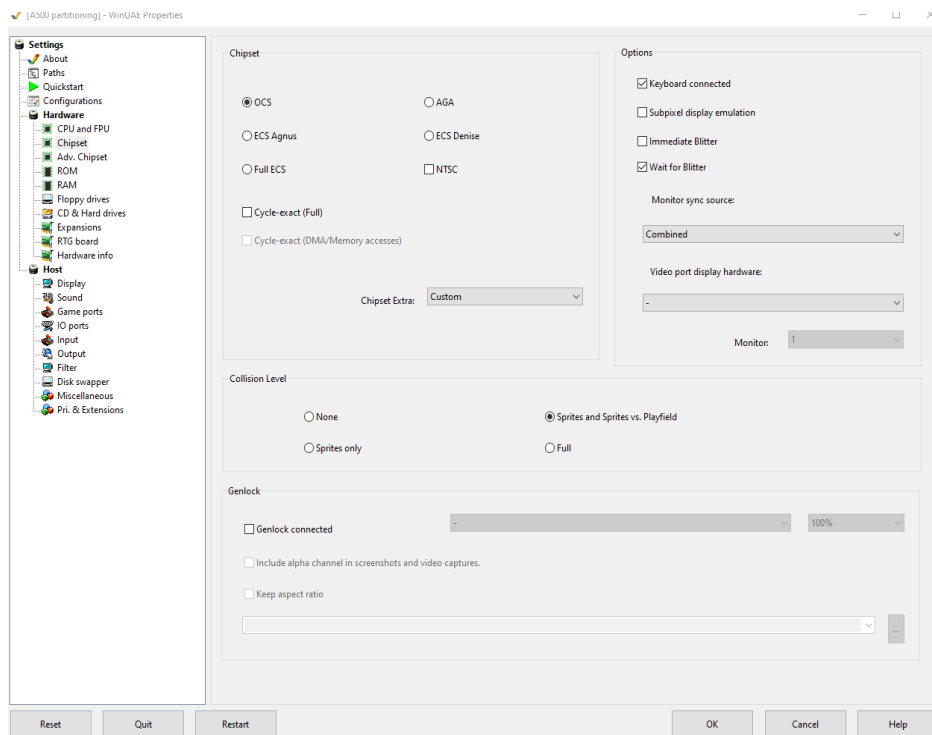

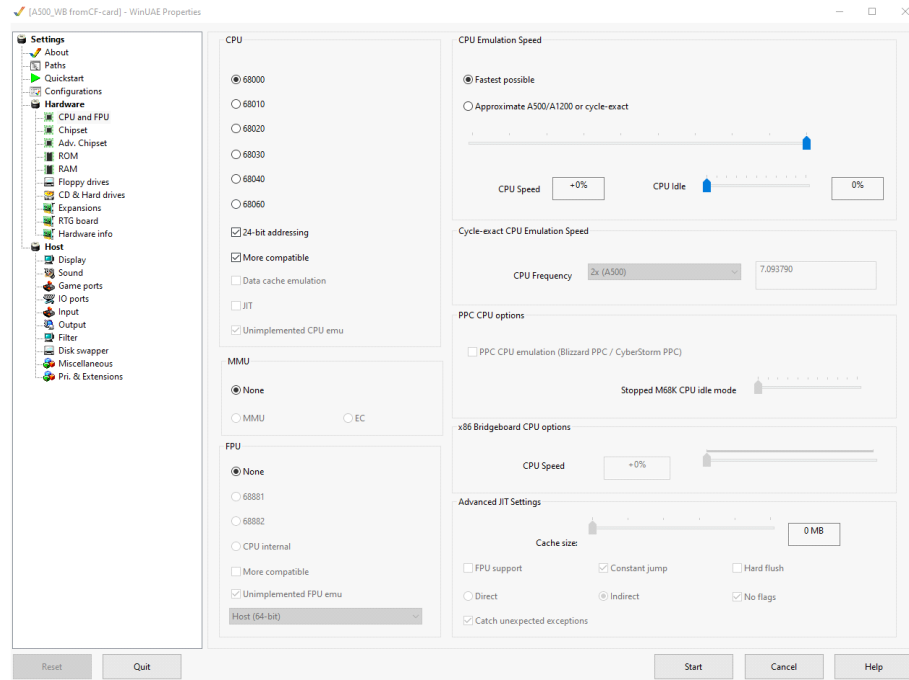

Leaving DiskPart...

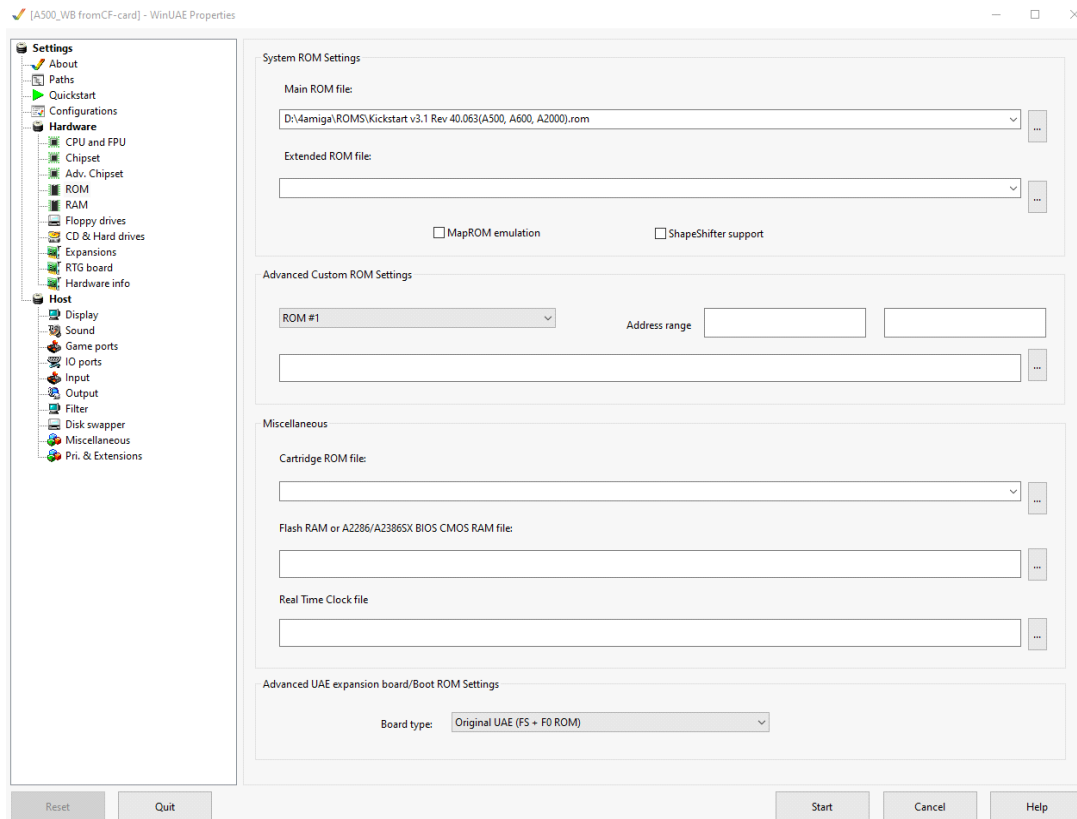

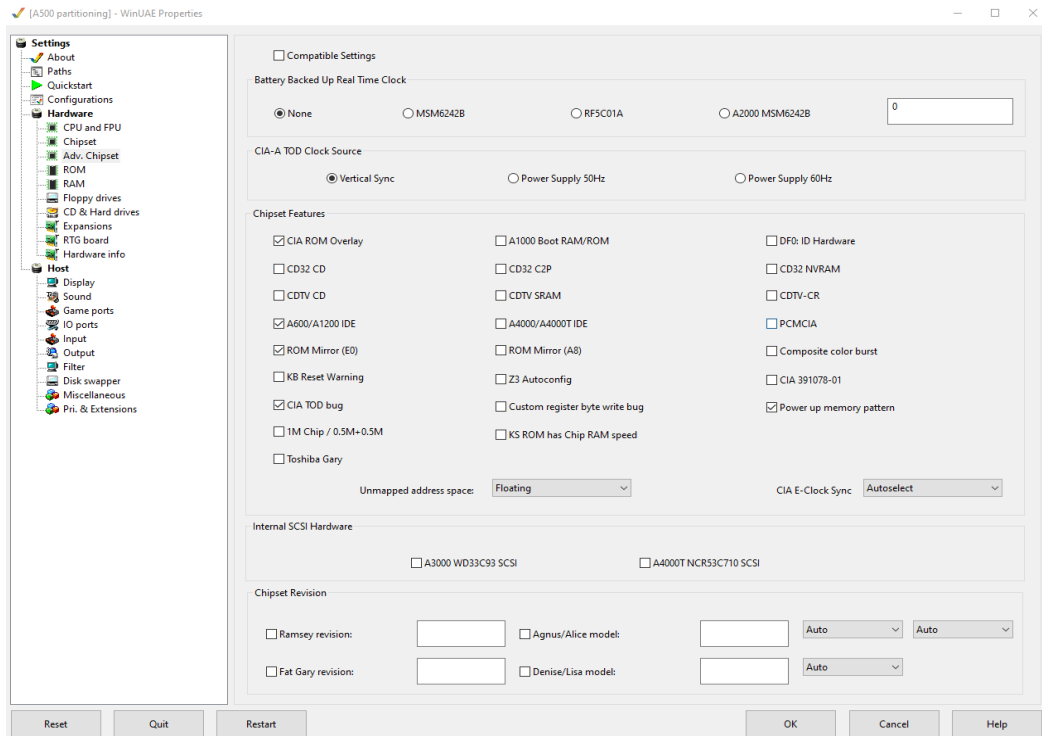

C:\Windows\system32>
```

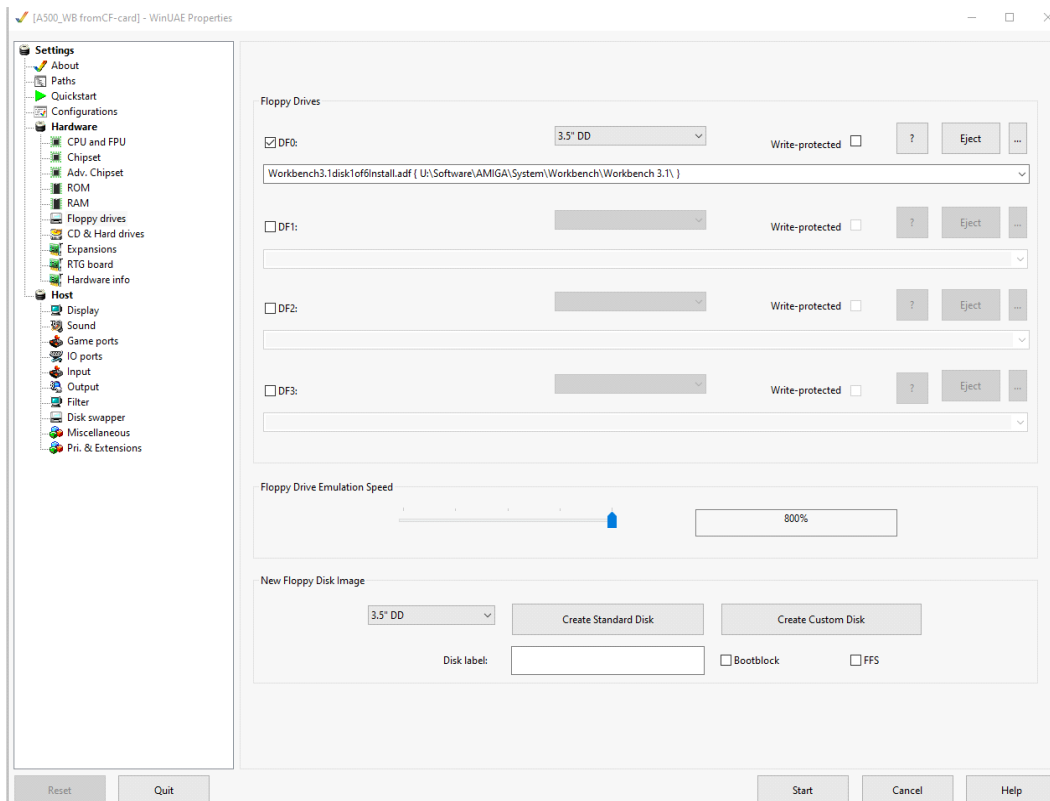

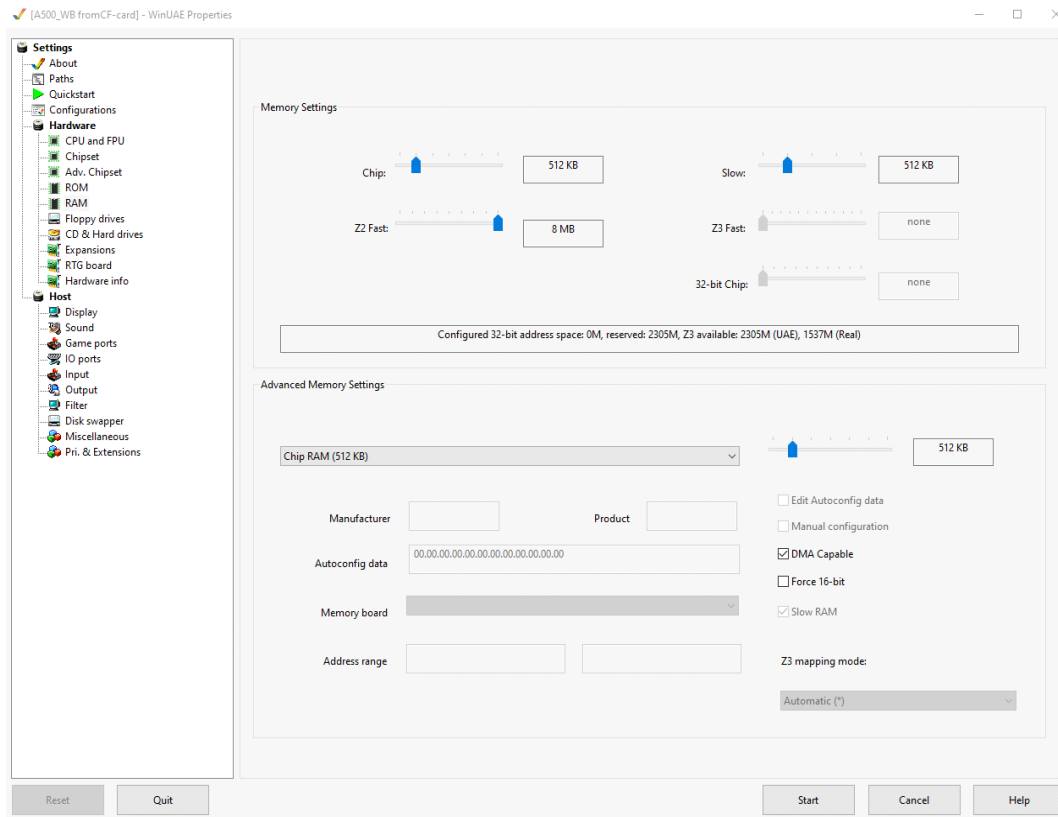

## 2. Partitioning the disk in WinUAE.

Sometimes WinUAE needs to be run “as Administrator.”

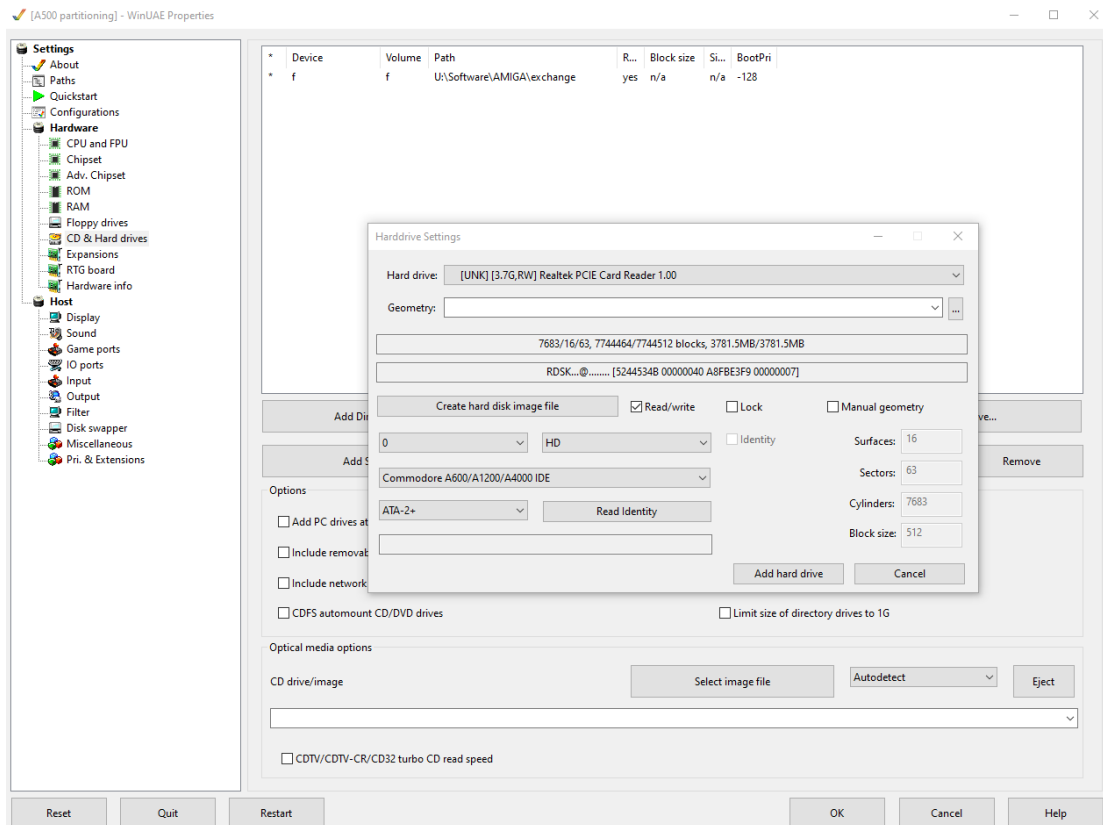

Use the following configuration.

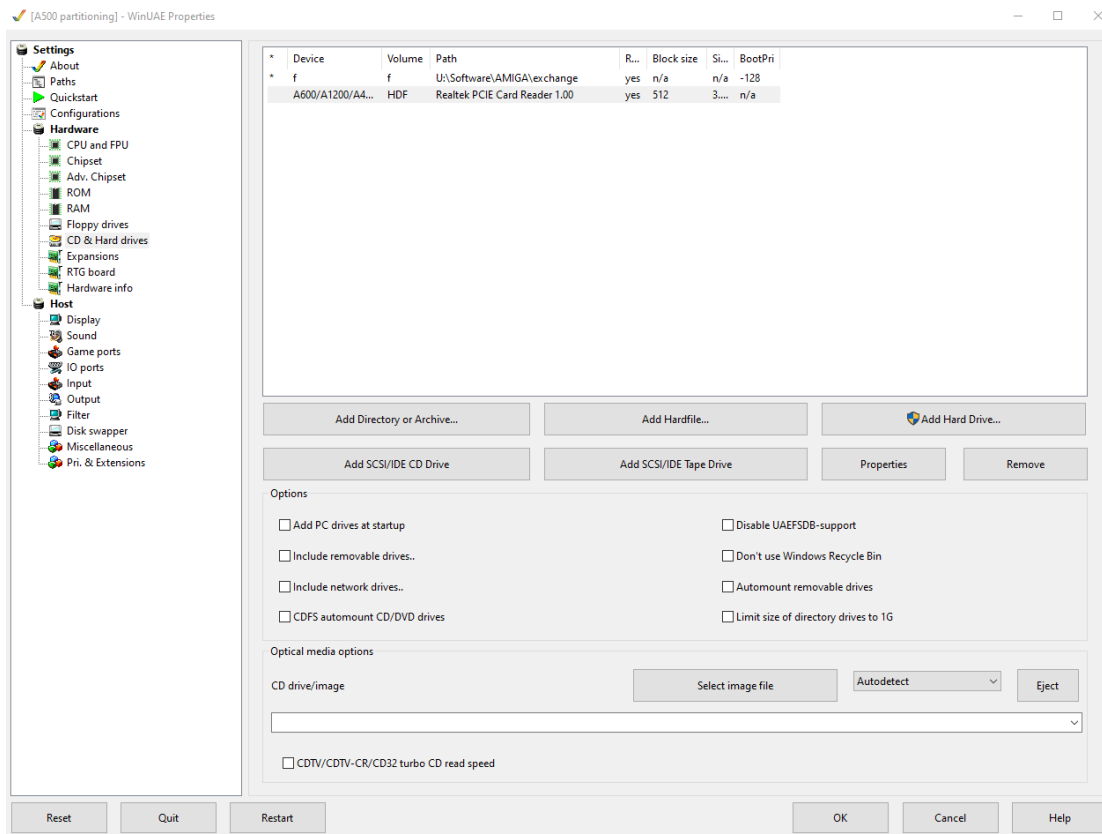

In “CD and Hard drives” add your shared folder with “pfs3aio” as drive “f” and add a CF-card as A600/A1200/... IDE.

**Write down CHS parameters:**

Press “Add hard drive”.

All other settings keep by default.

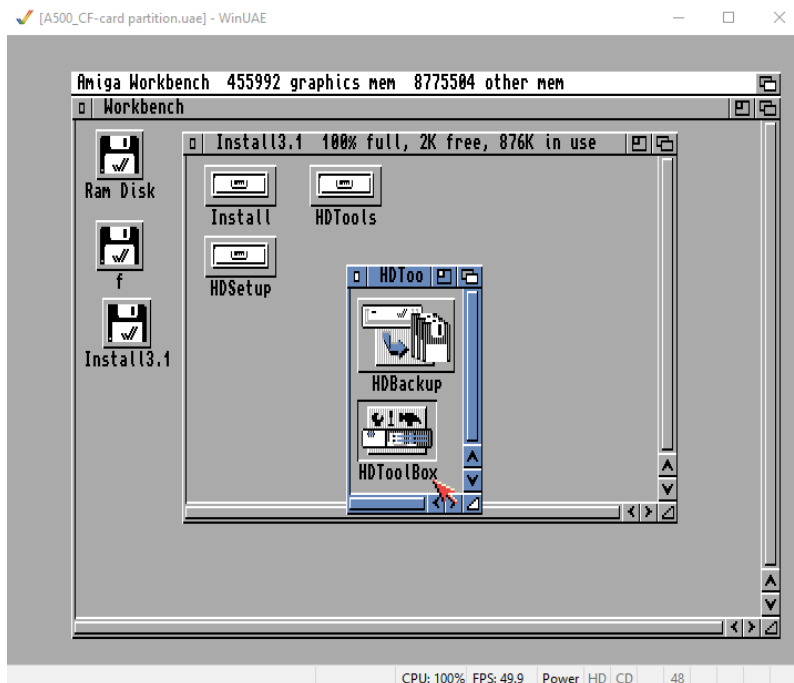

Press “Start”

### 3. Partition the drive in Workbench.

Load Workbench from “Install” floppy.

Open “Install 3.1\HDTools”, select HDToolBox.

Right-click on it, select “Icons\Information”.

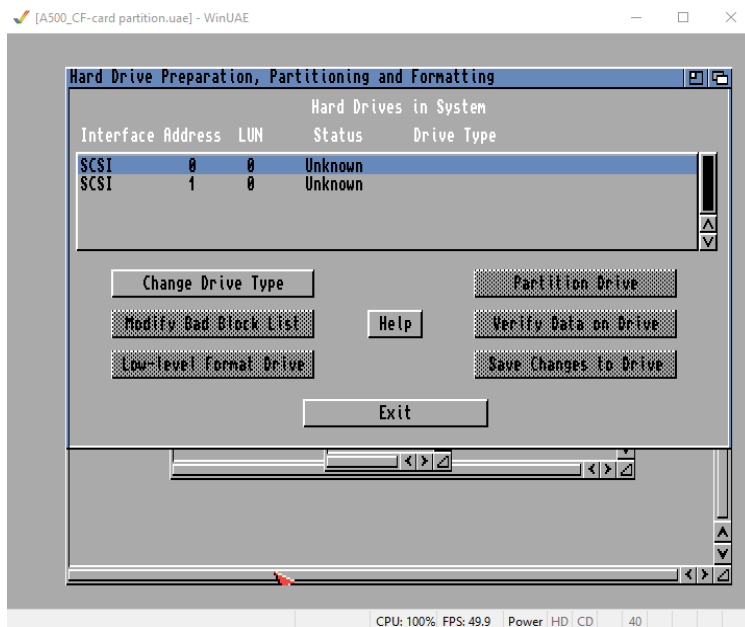

Check **SCSI\_DEVICE\_NAME** is set to **scsi.device**.

Note:

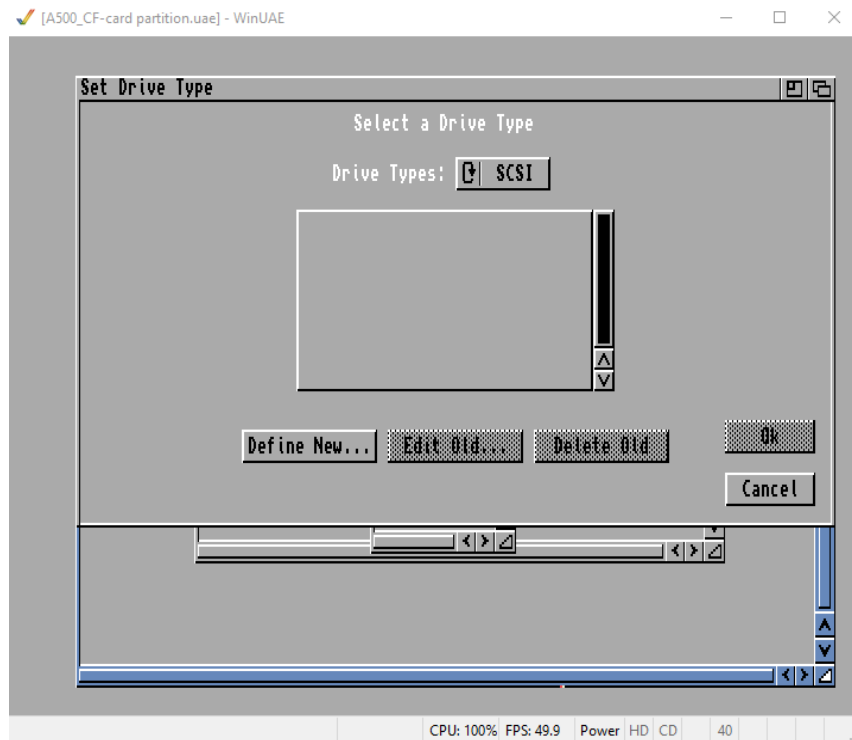

- For real Amiga 600/1200 it shall be **scsi.device**.
- For **Oktagon** IDE controller it shall be **oktagon.device**. **[Important]**

Run HDToolBox:

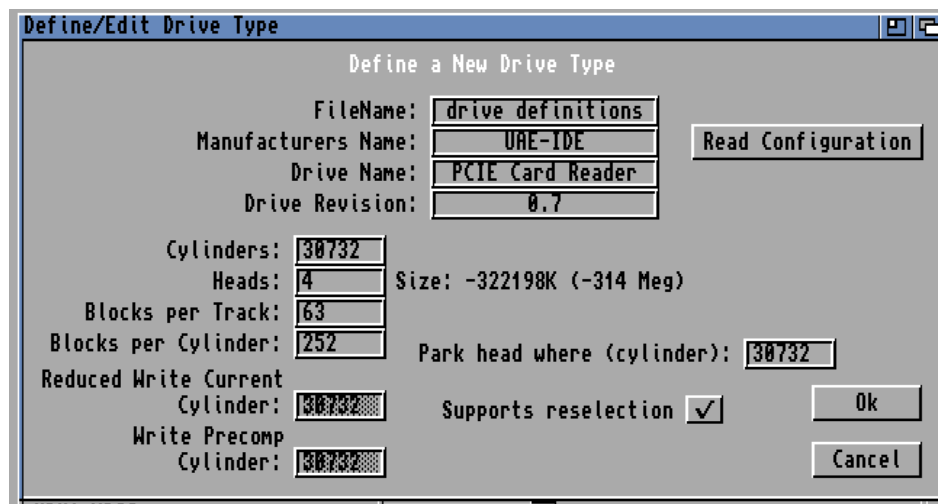

Press “Change Drive type”. Delete all old configurations (not mandatory).

Press “Define New”. Then press “Read configuration”.

Change CHS **using your card values if they are not matching**.

Below is my example.

Cylinders = 30732

Heads = 4

Blocks per track (sectors) = 63

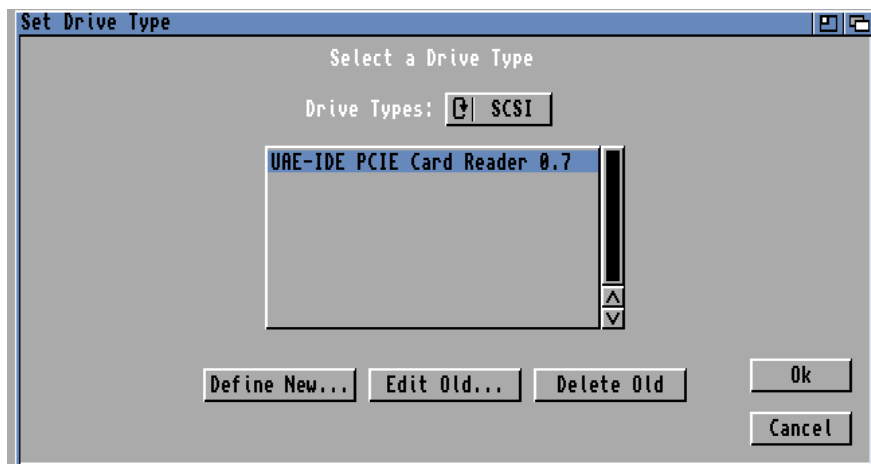

Blocks per cylinder = Sectors \* Heads = 252

**Ignore weird size value.**

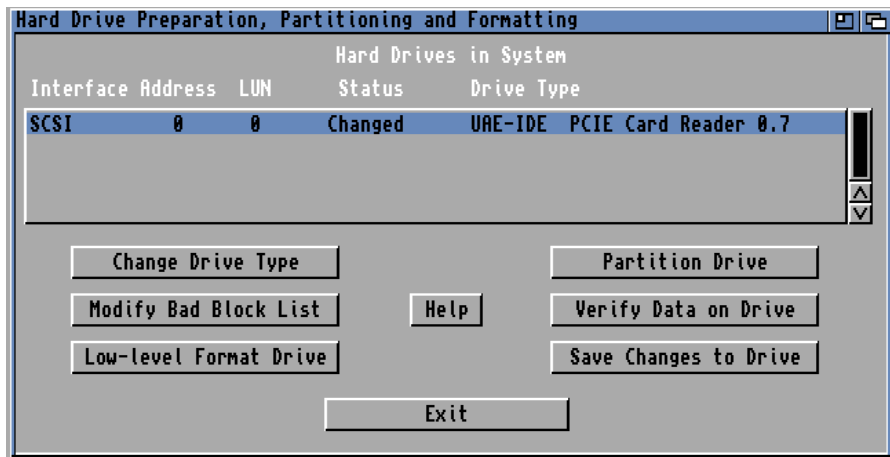

Note: Every time changing any value **PRESS ENTER!**

Press "Ok".

Press "Ok".

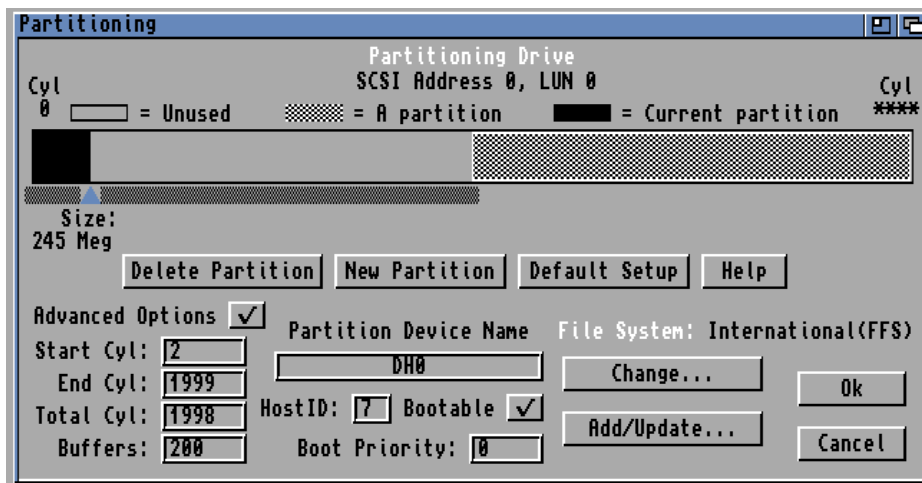

Press “Partition Drive”.

Check “Advanced options”.

Change drive name to “DH0”, increase “Buffers” to 200.

Set desired size for the first partition. I set it to 245MB.

Add **pfs3aio** File System:

- Press “Add/Update...” button. Press “Add new filesystem”, enter “pfs3aio” which is located in my case in “f” drive.

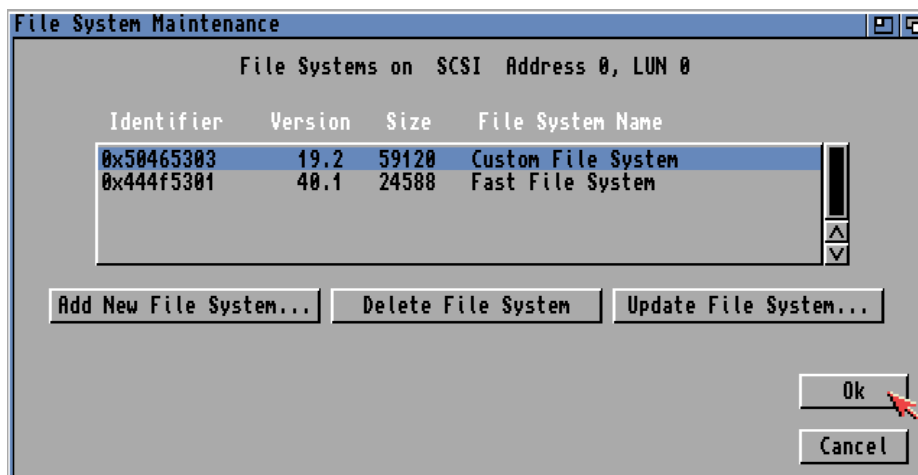

Press "OK".

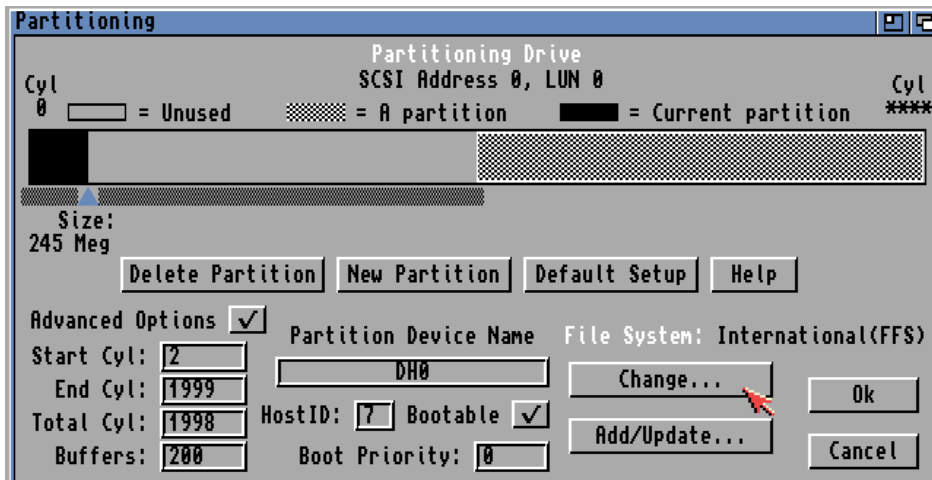

Change DosType to 0x50465303, press Enter.

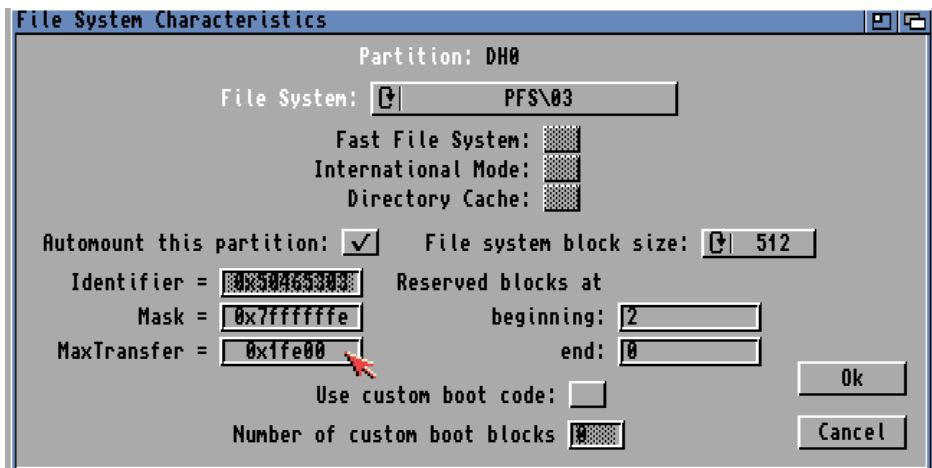

Press "OK".

Press "OK".

Press "Change..."

Pressing the circle with arrow, change Filesystem to PFS\03.

Change **MaxTransfer** to **0x1fe00**.

Press "OK".

Repeat the same with second partition.

Click on it:

Change start cylinder to the next after end cylinder of the first partition.

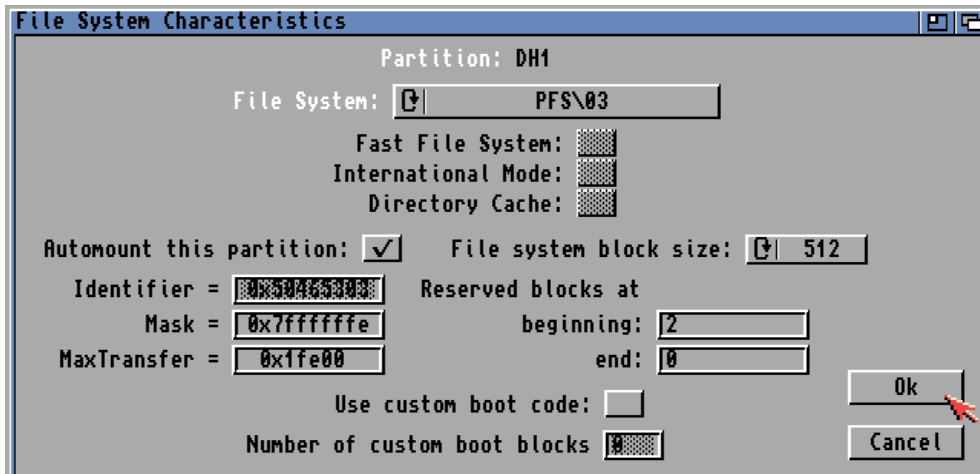

Change buffers to 200.

Change Device name to DH1.

Click back on the first partition and check if Buffers not changed back to 30. If so, change it again.

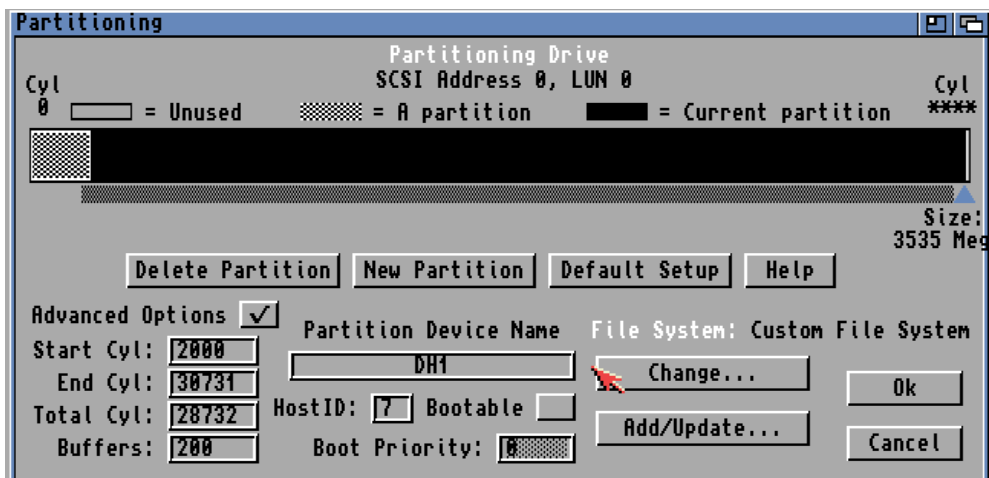

Click on the second partition. Check the same with all parameters.

Click "Change.." to change Filesystem to PFS3.

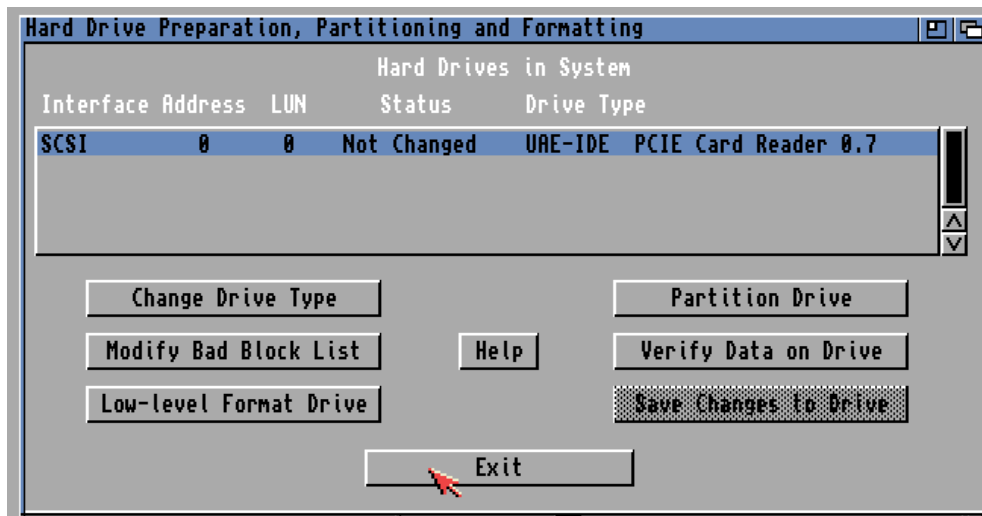

Set the values as shown.

Press "OK". Check Buffers again.

Press "OK".

Press "Save changes to drive".

Press "Exit" then **REBOOT**.

After restart, two unformatted drives DH0 and DH1 should appear.

Right click on DH0, select "Icons\Format Disk". Then "**Quick format**".

Press "Format" a couple of times then "OK".

**Do the same for DH1.**

*Install Workbench using installation floppy or copy already installed files from another disk/CF-card.*
